

Project Design Phase

Proposed Solution

Date	28 September 2026
Team ID	SWTID-2026-2588
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Proposed Solution :

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	In a school environment, students and teachers frequently raise IT support requests related to Wi-Fi, projectors, passwords, and slow computers. IT helpdesk staff manually review and classify these tickets, which can cause delays, inconsistent categorization, and additional workload.
2	Idea / Solution Description	The proposed solution uses ServiceNow Flow Designer to automatically classify newly created IT tickets based on predefined keywords in the short description or issue description. The flow assigns the appropriate Category and Subcategory, maintains dependent choice relationships, and sends an automated email confirmation to the caller.
3	Novelty / Uniqueness	The solution combines a custom ServiceNow ticket table, Flow Designer automation, keyword-based classification, dependent choices, and automatic email notification into one workflow. It provides a no-code/low-code approach that does not require a separate machine-learning model or external application.
4	Social Impact / Customer Satisfaction	The solution improves the support experience for students and teachers by providing faster ticket processing and immediate confirmation. IT staff benefit from reduced repetitive work and consistent ticket categorization. This can contribute to a more efficient and responsive school IT support system.
5	Business Model (Revenue Model)	The project is primarily designed as an academic and institutional IT automation solution rather than a direct revenue-generating product. In a real-world implementation, it could be provided as part of a ServiceNow implementation or IT workflow automation service, where organizations pay for platform licensing, configuration, customization, and support.
6	Scalability of the Solution	The solution can be expanded by adding more categories, subcategories, keywords, notification rules, and automated assignments. Additional workflows can also be introduced for SLA tracking, assignment-group routing, escalation, and reporting. Since it is built on the ServiceNow platform, the workflow can be adapted to handle increasing numbers of IT tickets.

Proposed Solution Summary

The proposed Auto Ticket Classification using Flow Designer solution automates the classification of school IT support tickets. When a ticket is created, the Flow Designer workflow checks the issue description against predefined conditions and automatically

assigns the relevant category and subcategory. It then sends a confirmation email to the caller.

The solution reduces manual classification effort, improves consistency, provides faster processing, and creates a structured foundation for future IT service automation.
