

Project Design Phase

Problem – Solution Fit

Date	28 September 2026
Team ID	SWTID-2026-2588
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Problem – Solution Fit :

The **Auto Ticket Classification using Flow Designer** project addresses the problem of manual classification and routing of IT support tickets in a school environment. Students and teachers frequently report issues such as Wi-Fi connectivity problems, projector failures, forgotten passwords, and slow computers. Traditionally, IT helpdesk staff must manually review each ticket, identify the issue, select the appropriate category and subcategory, and begin the support process.

This manual process can consume time, result in inconsistent classification, and delay ticket handling. To address this problem, the proposed solution uses **ServiceNow Flow Designer** to automatically analyze the ticket description using predefined keyword-based rules and assign the appropriate **Category** and **Subcategory**.

The solution also provides automated email confirmation to the caller after ticket creation. Dependent choice logic ensures that the selected subcategory corresponds correctly to its category. This reduces repetitive work for IT staff, improves consistency, and provides a more structured ticket management process.

Problem–Solution Fit Analysis

Customer/User Problem	Existing Situation	Proposed Solution	Expected Benefit
Tickets take time to classify	IT staff manually read and categorize every ticket	Flow Designer automatically classifies tickets based on keywords	Reduces manual effort
Incorrect or inconsistent categorization	Different staff members may classify similar issues differently	Predefined classification rules are applied consistently	Improves classification consistency
Tickets may be routed slowly	Classification must be completed before further processing	Category and subcategory are assigned automatically after creation	Faster ticket processing
Users may not receive immediate confirmation	Confirmation may depend on manual communication	Automated email is sent after ticket creation	Improves user communication
Subcategories may not match categories	Users or agents may select unrelated choices	Dependent choice logic restricts valid subcategories	Improves data accuracy

Increasing ticket volume creates workload	Manual processing becomes difficult as requests increase	Automated workflow handles repetitive classification tasks	Supports scalability
Ticket information may be inconsistent	Manual data entry can produce variations	Standardized fields and predefined choices are used	Improves data organization

Target Users

1. **Students and Teachers** – Submit IT support requests and receive confirmation after ticket creation.
2. **IT Helpdesk Agents** – Receive consistently classified tickets and spend less time on repetitive categorization.
3. **School IT Administrator** – Gets a structured and maintainable ticket management process.

Solution Fit

The proposed solution fits the identified problem because it directly automates the most repetitive part of the school IT helpdesk process: **ticket classification**. Instead of requiring an IT agent to manually determine the category and subcategory, Flow Designer applies predefined rules immediately after a ticket is created.

For example:

- **“Wi-Fi not working in the library”** → Category: **Network**, Subcategory: **Wi-Fi**
- **“Projector is not turning on”** → Category: **Hardware**, Subcategory: **Projector**
- **“I forgot my password”** → Category: **Access**, Subcategory: **Forgot Password**
- **“Computer is very slow”** → Category: **Performance**, Subcategory: **Slow Computer**

Therefore, the solution addresses the major pain points identified during the empathy and problem-definition stages while providing a simple, maintainable, and scalable workflow for the school IT helpdesk.

Problem–Solution Fit Statement

For school students, teachers, and IT helpdesk staff who face delays and inconsistency in manual IT ticket classification, the proposed Auto Ticket Classification using Flow Designer provides an automated, rule-based classification and notification process that reduces manual effort, improves data consistency, speeds up ticket processing, and provides immediate confirmation to users.
